In the first survey on security issues in robot swarms, Higgins et al. (2009) identify tampered swarm members or failing sensors, attacked or noisy communication channels, and loss of availability as the main threats to robot swarms. Tarapore et al. (2015, 2017, 2019) address the detection of faulty robots in both simulated and physical robot swarms. Their method is based on outlier detection using the bioinspired crossregulation model.

Compared with individual robots, a swarm can commonly decompose its given missions to their subtasks; A swarm is more robust to partial swarm failure and is more flexible with regard to different missions . One such swarm system is the LIBOT Robotic System that involves a low cost robot built for outdoor swarm robotics. The robots are also made with provisions for indoor use via Wi-Fi, since the GPS sensors provide poor communication inside buildings.
