There are many distinct pleasures associated with computer programming. Craftsman- ship has its quiet rewards, the satisfaction that comes from building a useful object and making it work. Excitement arrives with the ?ash of insight that cracks a previously intractable problem. The spiritual quest for elegance can turn the hacker into an artist. There are pleasures in parsimony, in squeezing the last drop of performance out of clever algorithms and tight coding. The games, puzzles, and challenges of problems from international programming competitions are a great way to experience these pleasures while improving your algorithmic and coding skills. This book contains over 100 problems that have appeared in previous programming contests, along with discussions of the theory and ideas necessary to - tack them. Instant online grading for all of these problems is available from two WWW robot judging sites. Combining this book with a judge gives an exciting new way to challenge and improve your programming skills. This book can be used for self-study, for teaching innovative courses in algorithms and programming, and in training for international competition. To the Reader The problems in this book have been selected from over 1,000 programming problems at the Universidad de Valladolid online judge, available at <http://online-judge.uva.es>. The judge has ruled on well over one million submissions from 27,000 registered users around the world to date. We have taken only the best of the best, the most fun, exciting, and interesting problems available.

This is the third in the Modelling Manual series which deals with the basics of military vehicle modelling - one of the most popular subjects for modellers. The first of three books to deal with this fascinating subject, Basic Vehicle Modelling introduces the modeller to some basic model types with a series of close up, step by step photographs. Working with kits from Tamiya, Verlinden, Revell and others, the less experienced modeller is shown the do's and don'ts of modelling techniques, with particular emphasis on the common difficulties that the inexperienced modeller might face. This series will build into a library of practical information for the modeller.

The Art of Control Engineering provides a refreshingly new and practical treatment of the study of control systems. The opening chapters assume no prior knowledge of the subject and are suitable for use in introductory courses. The material then progresses smoothly to more advanced topics such as nonlinear systems, Kalman filtering, robust control, multivariable systems and discrete event controllers. Taking a practical perspective, the text demonstrates how the various techniques fit into the overall picture of control and stresses the ingenuity required in choosing the best tool for each job and deciding how to apply it. The most important topics are revisited at appropriate levels throughout the book, building up progressively deeper layers of knowledge. The Art of Control Engineering is an essential core text for undergraduate degree courses in control, electrical and electronic, systems and mechanical engineering. Its broad, practical coverage will also be very useful to postgraduate students and practising engineers.

This book provides state of the art scientific and engineering research findings and developments in the field of humanoid robotics and its applications. It is expected that humanoids will change the way we interact with machines, and will have the ability to blend perfectly into an environment already designed for humans. The book contains chapters that aim to discover the future abilities of humanoid robots by presenting a variety of integrated research in various scientific and engineering fields, such as locomotion, perception, adaptive behavior, human-robot interaction, neuroscience and machine learning. The book is designed to be accessible and practical, with an emphasis on useful information to those working in the fields of robotics, cognitive science, artificial intelligence, computational methods and other fields of science directly or indirectly related to the development and usage of future humanoid robots. The editor of the book has extensive R

In this paradigm-shattering book, leading behavioural economist and food psychologist Brian Wansink - dubbed the 'Sherlock Holmes of food' and the 'wizard of why' - offers a radical new philosophy for weight loss. The answer isn't to tell people what to do: it's to set up their living environments so that they will naturally lose weight. Using cutting-edge, never-before-seen research from his acclaimed Food and Brand Lab at Cornell University, Wansink reveals how innovative and inexpensive design changes - from home kitchens to restaurants, from grocery stores to schools and workplaces - can make it mindlessly easy for people to eat healthier and make it more profitable for the companies who sell the food. In Slim by Design, Wansink argues that the easiest, quickest and most natural way to reverse weight gain is to work with human nature, not against it. He demonstrates how schools can nudge kids to take an apple instead of a cookie, how restaurants can increase profits by selling half-size portions, how supermarkets can double the amount of fruits and vegetables they sell, and how anyone can cut plate refills at home by more than a third. Interweaving drawings, charts, floor plans and scorecards with new scientific studies and compelling insights that will make you view your surroundings in an entirely fresh way, this entertaining, eye-opening book offers practical solutions for changing your everyday environment to make you, your family and even your community slim by design.

Learn to design Home Plans in AutoCAD In this book, you will discover the process evolved in modeling a Home in AutoCAD from scratch to a completed two storied home. You will start by creating two-dimensional floor plans and elevations. Later, you will move on to 3D modeling and create exterior and interior walls, doors, balcony, windows, stairs, and railing. You will learn to create a roof on top of the home. You will add materials to the 3D model, create lights and cameras, and then render it. Also, you will learn to prepare the model for 3D printing.
