An overhead power line is a structure used in electric power transmission and distribution to transmit electrical energy across large distances. It consists of one or more uninsulated electrical cables (commonly multiples of three for three-phase power) suspended by towers or poles. Since most of the insulation is provided by the surrounding air, overhead power lines are generally the least ...

Overhead power line - Wikipedia

Generally, electric overhead lines use to stay exposed to wind and lightning, to trees and animals and to cars and kites. For this reason, it is one of the critical components in the reliability of the distribution circuits system. Related: Fundamental of Electric Power Distribution System. Normally electric overhead constructions come in a variety of configurations. Generally, one primary circuit is used per pole but utilities sometimes run more than one circuit per structure.
