MX341 AUTOMATIC VOLTAGE REGULATOR (AVR) SPECIFICATION, INSTALLATION AND ADJUSTMENTS General description Technical specification. MX341 is a two phase sensed Automatic Voltage Regulator and forms part of the excitation system for a brush-less generator. Excitation power is derived from a three-phase permanent magnet generator (PMG), to isolate the AVR control circuits from the effects of non- linear loads and to reduce radio frequency interference on the generator terminals.

MX341 AUTOMATIC VOLTAGE REGULATOR (AVR)

Automatic Voltage Regulator (AVR) and forms part of the excitation system for a brush-less generator. In addition to regulating the generator voltage, the AVR circuitry includes under-speed and sensing loss protection features. Excitation power is derived directly from the generator terminals.

SX460 AUTOMATIC VOLTAGE REGULATOR (AVR) - Generator Solutions

The AVR (automatic voltage regulator) is suitable for supplying power to the fields of either brushless or commutator type exciters and will maintain the A.C generator voltage within plus and minus 1% of the preset value with paralleling. When the load varies between no load and rated load and with a frequency changes more than plus minus 4%.Upon application or rejection of rated load,the generator voltage recovers to plus and minus 1% within 0.3 second on most AVR exciter in A.C generator ...

In an electronic AVR the set-point is adjusted by a variable resistance, or rheostat, in the appropriate part of the circuit. On some generators this rheostat is outside the AVR proper and is mounted on the adjacent generator control panel for manual control; it is usually marked 'Raise Volts/Lower Volts'.

This pushes the AVR to its limits. If the AVR is pushed beyond it's limits the excitation field collapses. The output voltage is reduced to a small amount. If a short circuit occurs in the supply to the AVR, the generator will not have an excitation source. This causes a loss of generator power output.
