En la última década, se han producido en Perú grandes cambios en los que la innovación tecnológica ha sido el motor que ha impulsado el desarrollo económico. En todo ello, la participación del sector académico ha jugado un importante papel. Por otro lado, los procesos industriales deben contribuir al desarrollo sostenible, garantizar la satisfacción de las necesidades fundamentales de la población y elevar su calidad de vida, mediante la aplicación de tecnologías limpias que permitan el uso eficiente de los recursos naturales y energéticos, e incrementen la productividad y competitividad de la empresa. En este libro, se describen las diversas etapas de los procesos industriales con la ayuda de casos prácticos reales de los diferentes sectores de la industria peruana —pesquero, plástico, cemento, maltería, lácteos, reciclaje y generación de energía, entre otras— y se pone énfasis en la aplicación de tecnologías limpias innovadoras, el balance de recursos materiales y de energía, el tratamiento del agua, los efluentes, las emisiones de gases y la gestión de residuos. Igualmente, se realiza la caracterización, el análisis y la evaluación ambiental, así como la mitigación de los impactos ocasionados por medio de la aplicación de medidas correctivas para prevenirlos y controlarlos.

Consistently practical in its coverage, the book discusses general issues related to forecasting and management; introduces a variety of methods, and shows how to apply these methods to significant issues in managing technological development. With numerous exhibits, case studies and exercises throughout, it requires only basic mathematics and includes a special technology forecasting TOOLKIT for the IBM and compatibles, along with full instructions for installing and running the program.

A successful modern heavy metal control program for any industry will include not only traditional water pollution control, but also air pollution control, soil conservation, site remediation, groundwater protection, public health management, solid waste disposal, and combined industrial-municipal heavy metal waste management. In fact, it should be a total environmental control program. Comprehensive in scope, *Heavy Metals in the Environment* provides technical and economical information on the development of a feasible total heavy metal control program that can benefit industry and local municipalities. The book discusses the importance and contamination of metals such as lead, chromium, cadmium, zinc, copper, nickel, iron, and mercury. It covers important research of metals in the environment, the processes and mechanisms for metals control and removal, the environmental behavior and effects of engineered metal and metal oxide nanoparticles, environmental geochemistry of high arsenic aquifer systems, nano-technology applications in metal ion adsorption, biosorption of metals, and heavy metal removal by expopolysaccharide-producing cyanobacteria. The authors delineate technologies for metals treatment and management, metal bearing effluents, metal-contaminated solid wastes, metal finishing industry wastes and brownfield sites, and arsenic-contaminated groundwater streams. They also discuss control, treatment, and management of metal emissions from motor vehicles. The authors reflect the breadth of the field and draw on personal experiences to provide an in-depth presentation of environmental pollution sources, waste characteristics, control technologies, management strategies, facility innovations, process alternatives, costs, case histories, effluent standards, and future trends for each industrial or commercial operation. The methodologies and technologies discussed are directly applicable to the waste management problems that must be met in all industries.

As every civil engineer knows, Portland Cement is the most versatile and important material of construction, and will probably remain so far into the future. Yet few books, if any, exist that offer an in-depth analysis of the mixing and testing methods of this vital hydraulic cement. This statement, written about the first edition of *Engineere*

Includes precise directions for a long list of contaminants! All contaminants you can analyze or monitor with a given method are consolidated together to facilitate use. This book is especially valuable for indoor and outdoor air pollution control, industrial hygiene, occupational health, analytical chemists, engineers, health physicists, biologists, toxicologists, and instrument users.

The beginnings of human civilization can be traced back to the time, nearly 12,000 years ago, when the early humans gradually changed from a life of hunting and gathering food, to producing food. This beginning of primitive agriculture ensured a dependable supply of food, and

fostered the living together of people in groups and the development of society. During this time, plants seeds were recognized as a valuable source of food and nutrition, and began to be used for growing plants for food. Ever since, plant seeds have played an important role in the development of the human civilization. Even today, seeds of a few crop species, such as the cereals and legumes, are the primary source of most human food, and the predominant commodity in international agriculture. Owing to their great importance as food for humans and in international trade, seeds have been a favorite object of study by developmental biologists and physiologists, nutritionists and chemists. A wealth of useful information is available on the biology of seeds.

Covers challenges to the mining industry with technical contributions on topics such as: investment, potential and evaluation; open-pit technology; mineral processing; solvent extraction; transportation, conveyor design and practice; environmental issues; and smelting and refining.
