The primary function of the skeletal system is to provide a solid framework to support and safeguard the human body and its organs.

Skeletal System – Anatomy & Physiology of Human Skeletal ...

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

6.1 The Functions of the Skeletal System – Anatomy ...

The science of physiology often studies the functions of different body parts or organ systems of a living creature. In this light, the physiology of the skeletal system can be enumerated in five words: shape, support, protection, storage, and movement. These functions apply both to the human body and almost all animals categorized as vertebrates.

Compact bone forms the diaphysis of the the long bones, and the outer shell of the epiphyses and all other bones. Composed of haversian systems that run lengthwise with the bone.

Haversian Systems. Concentric layers of ossified bone matrix arranged around a central canal which houses blood and lymph vessels.
