"With the ever increasing global economic interaction that often involves the workplace, it is imperative that we deepen our understanding of the dynamics of communication among different cultures. Through clear and precise examples, Dr. Theresa Paris' book succinctly exemplifies the basic broad differences of cultures and the importance of understanding cultural interaction in the workplace, based on work developed by Dr. Geert Hofstede, a pioneer and international leading scientist in the field of International Communication. These basic principles are applicable to most cultures. This book is a must for managers and students, and offers general information to all who wish to expand their knowledge of people to people interaction." Hector Robertin Ph.D."Multiculturalism in the Workplace engages everyone from the expert to the lay reader in principles validated through academic research. Through Barb's story, the reader is invited to explore the high level of misunderstanding among cultures and seek solutions for collaborative team development. Dr. Paris has simplified the understanding of Hofstede's research on cultural measurements in business by connecting them to different cultural traits, such as individualism and collectivism. Even the newest person to the study of multiculturalism will acquire excellent tools for interpreting actions and behaviors within his/her own environment." Sharon Seeberger, B.A.

Professionals and students who come from disciplines other than chemistry need a concise yet reliable guide that explains key concepts in environmental chemistry, from the fundamental science to the necessary calculations for applying them. Updated and reorganized, Applications of Environmental Aquatic Chemistry: A Practical Guide, Third Edition provides the essential background for understanding and solving the most frequent environmental chemistry problems. Diverse and self-contained chapters offer a centralized and easily navigable framework for finding useful data tables that are ordinarily scattered throughout the literature. Worked examples provide step-by-step details for frequently used calculations, drawing on case histories from real-world environmental applications. Chapters also offer tools for calculating quick estimates of important quantities and practice problems that apply the principles to different conditions. This practical guide provides an ideal basis for self-study, as well as short courses involving the movement and fate of contaminants in the environment. In addition to extensive reorganization and updating, the Third Edition includes a new chapter, Nutrients and Odors: Nitrogen, Phosphorus, and Sulfur, two new appendices, Solubility of Slightly Soluble Metal Salts and Glossary of Acronyms and Abbreviations Used in this Book, and new material and case studies on remediation, stormwater management, algae growth and treatment, odor control, and radioisotopes.

A primer on modeling concepts and applications that is specifically geared toward the environmental field. Sections on modeling terminology, the uses of models, the model-building process, and the interpretation of output provide the foundation for detailed applications. After an introduction to the basics of dynamic modeling, the book leads students through an analysis of several environmental problems, including surface-water pollution, matter-cycling disruptions, and global warming. The scientific and technical context is provided for each problem, and the methods for analyzing and designing appropriate modeling approaches is provided. While the mathematical content does not exceed the level of a first-semester calculus course, the book gives students all of the background, examples, and practice exercises needed both to use and understand environmental modeling. It is suitable for upper-level

undergraduate and beginning-graduate level environmental professionals seeking an introduction to modeling in their field.

The substances considered in this review, i.e. benzene, carbon monoxide, formaldehyde, naphthalene, nitrogen dioxide, polycyclic aromatic hydrocarbons (especially benzo[a]pyrene), radon, trichloroethylene and tetrachloroethylene, have indoor sources, are known in respect of their hazardousness to health and are often found indoors in concentrations of health concern. The guidelines are targeted at public health professionals involved in preventing health risks of environmental exposures, as well as specialists and authorities involved in the design and use of buildings, indoor materials and products. They provide a scientific basis for legally enforceable standards.
